Memo to File:

Re: Atlas Minerals
Four Corners Mine
Emery County, Utah
ACT/015/014

This mining operation was inspected by Mike Thompson and Jim Smith along with John Hunerjager, Dean Roberts, and Rick Dye of Atlas Minerals. on May 10, 1978

This operation consists of a series of old workings, some of which are currently active. The Newall shaft is abandoned and is planned to be the area used for revegetation test plots. The Number 2 decline area is active with some declines being used for ventilation. The Number 4, 5, and 6 decline area is active with a county road running through the middle of the operation. The declines which are not being used are fenced. The Jack Rabbit Shaft is used only for ventilation and has some waste rock and junk left from previous operations. The Number 9 decline is currently abandoned with approximately two (2) acres of surface disturbance consisting of miscellaneous junk and old buildings. The Number 8 decline and shaft is used for ventilation in the Dino decline, also abandoned and consisting of old buildings and waste dumps.

It was suggested that Atlas incorporate some additional species into their revegetation test plots to arrive at a more diverse composition for reclamation purposes.

As it now stands, the operation and plan appear to have no problems and should be granted tentative approval, etc.
